Simple telecare equipment can help residents stay safe and independent

Scared of falling at home

At 93, Margaret's senses are not what they used to be, and recently, she has had a few falls and stumbles at home, which are worrying. Margaret's GP told her about Telecare sensors which can detect if she falls, and alert a monitoring centre that would get her some assistance, or the emergency services if needed.

What difference has Telecare made to Margaret?

"While I wasn't too sure about all this to start with, knowing that I wasn't alone and could be helped when needed, made me feel much more confident at home. It's a win-win situation; I keep my independence but can rely on an immediate response if I fall again."

Margaret's* Story

*name has been changed

Falls detector This device raises an alarm in the monitoring centre automatically, when movement and impact associated with a fall is detected.

How telecare works

The falls detector is one of the many telecare sensors that links to a community alarm to enable it to communicate with the 24 hour monitoring centre. The free 12 week trial offer includes a community alarm provided by Surrey's borough and district councils.

After 12 weeks, if you decide to keep the community alarm and telecare sensor, you pay only for the community alarm which costs between £4 and £5 a week, depending where you live. The additional sensors are absolutely FREE.

Telecare sensors are designed to help people of all ages to live more independently by monitoring their safety around the home. Other sensors available to meet specific needs include linked smoke alarm, pill dispenser, gas and carbon monoxide detectors.
